

# EXTRUDER SCREEN PACKS

PSI offers square weave screens, the most common type of weave where each weft wire passes over and under each warp wire alternatively, providing a stable structure.

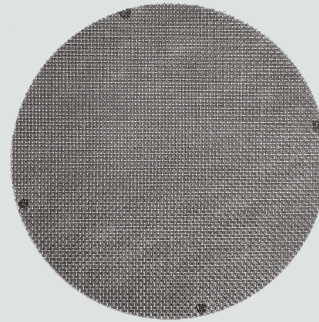

All screens are manufactured from Stainless Steel for superior corrosion resistance, strength and ability to withstand high temperatures.

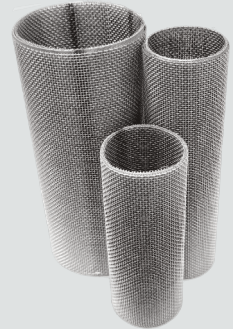

Single screens  
with sizes 5 to 550 mesh  
[5000 to 25 micron].

Bound screens –  
seamless frame of  
soft aluminum for a  
better seal at the edge  
of the breaker plate.

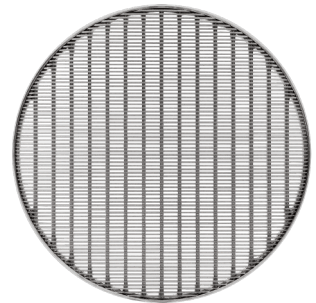

Weld-packs –  
for increased bend  
resistance and pack  
integrity.

Tubular screens.

## SUPER PLATE

Super Plates lift the screen pack away from the flat surface of the breaker plate and increase screen filtration efficiency up to 95%+. This yields longer screen life and saves money by eliminating the 20 & 40 mesh base screens.
